

Descriptive Analytics Report: Zomato

Daily Food-Delivery Order Behavior at Scale

Tracking Order Trends, Cuisine Preferences, Regional Demand & Customer Behavior

Note on data: This report uses a simulated Zomato food-delivery order dataset containing 10,932 orders across 90 dates (1 April – 29 June 2026), 14 cities and 5 cuisine categories. The dataset is row-level order data rather than pre-aggregated summaries. Therefore, the analysis derives all KPIs directly from the supplied records and does not assume a larger real-time Zomato order stream.

Name: Sangini Srivastava

Roll No.: 1250258387

Section: DS 22

1. Objective

Build a descriptive analytics layer over Zomato food-delivery order data to answer the following recurring business questions:

- How are daily order volumes trending over time?
- How is daily GMV (order value) trending over time?
- Which cuisine category contributes the highest order volume?
- Which cuisine categories contribute the most to overall GMV?
- Which cities generate the highest order volumes?
- Which cities contribute the most GMV?
- Average discount levels across cuisine categories.
- City-level order demand geographically.
- How does repeat-customer share relate to order volume?
- Weekday and weekend order patterns.
- Customer Rating (equivalent to Customer Satisfaction).

2. How This Would Work at Real Scale

Processing large-scale food-delivery order events is an engineering problem before it is an analytics problem. A realistic architecture would collect order events, aggregate them by time/cuisine/city, store raw and aggregated data, and expose the resulting KPIs through a data visualization layer.

Layer	Purpose	Typical tools
Investigation	Research, understand and prepare the order dataset	Google, Claude & ChatGPT
Stream processing	Aggregate by cuisine, city and time	Jupyter Notebook (Python)
Storage	Retain raw and processed data	Excel files / CSV files
Batch aggregation	Daily KPI and summary metrics	Jupyter Notebook
Report	Present analysis, graphs and insights	Data Visualization / MS Word

3. Daily Order Volume

Over the supplied 90-day window, the dataset records 10,932 orders and approximately ₹40.22 Lakh in GMV. The daily chart below shows how order volume moves across the available dates.

Figure 1. Daily order volume

INSIGHTS:

- Daily order counts fluctuate in a stable range across the three-month window, without a strong upward or downward trend.
- A recurring weekly rhythm is visible, with higher-volume dates lining up with weekends.
- Monitoring daily order volume can help identify demand fluctuations.
- This can support kitchen-partner staffing and delivery-fleet capacity planning.

KPI:

Total orders: **10,932**

Days covered: **90**

Average orders/day: **≈121**

4. Daily GMV Trending Over Time

Total GMV in the supplied records is ₹40.22 Lakh (₹40,21,991.68). The average GMV per day is ₹44,689 while the highest daily aggregate GMV is ₹62,721. GMV is calculated as the sum of the dataset's order_value_inr field.

Figure 2. Daily GMV trend

INSIGHTS:

- GMV varies across the available dates, broadly tracking order volume.
- Higher GMV indicates stronger monetary order activity on that date.
- Daily GMV monitoring helps identify high-value order periods.
- GMV should be considered alongside order volume to understand demand more completely.

KPI:

Total GMV: ₹40,21,991.68

Average GMV per day: ₹44,689

Peak daily GMV: ₹62,721

5. Best-Performing Cuisine Categories

The supplied dataset spans 5 cuisine categories: North Indian, Chinese, South Indian, Italian, and Desserts & Bakery. North Indian is the leading category by order volume.

Figure 3. Order share by cuisine

INSIGHTS:

- North Indian leads with 34.45% of all orders, followed by Chinese at 23.58%.
- South Indian (20.99%), Italian (12.96%) and Desserts & Bakery (8.01%) make up the remainder.
- The cuisine mix suggests North Indian and Chinese drive the bulk of order frequency.

KPI:

Top category by orders: **North Indian**

Order share: **34.45%**

Categories represented: **5**

6. Cuisine Categories Contributing the Most to Overall GMV

While North Indian leads in order count, Italian's higher average order value narrows the gap in GMV terms even though its order share is comparatively small.

Figure 4. GMV by cuisine

INSIGHTS:

- North Indian contributes 39.30% of total GMV (≈₹15.81 Lakh), the largest single share, in line with its order-volume lead.
- Chinese contributes 22.96% of GMV, and Italian 18.32% despite a smaller order share, reflecting a higher average order value.
- South Indian and Desserts & Bakery together contribute under 20% of GMV, reflecting their lower average basket size.

KPI:

Top GMV category: **North Indian**

GMV share: **39.30%**

North Indian GMV: **₹15,80,766**

7. Cities Generating the Highest Order Volumes

Delhi is the largest city-level contributor by order volume, with 1,033 orders ($\approx 9.45\%$ of all recorded orders). The distribution shows demand is fairly spread across the 14 cities in the dataset, without extreme concentration in any single market.

Figure 5. Total orders by city

INSIGHTS:

- The top 6 cities (Delhi, Mumbai, Pune, Bengaluru, Hyderabad, Chennai) each record over 900 orders.
- Guwahati, Kochi and Ranchi sit at the lower end, each around 560–590 orders.
- City-level order analysis can help with regional partner-onboarding and marketing planning.

KPI:

Top-performing city: **Delhi**

Recorded orders: **1,033**

Share of total orders: **$\approx 9.45\%$**

8. Cities Contributing the Most GMV

Delhi is also the largest contributor by GMV, at ₹3.81 Lakh, consistent with its lead in order count and a broadly similar average order value across cities.

Figure 6. Total GMV by city

INSIGHTS:

- Delhi, Mumbai, Pune, Bengaluru and Hyderabad together account for the bulk of total GMV.
- GMV rankings closely mirror order-volume rankings, since average order values are fairly consistent across cities (₹355–375).
- High-GMV cities can be important markets for delivery-fleet and restaurant-partner investment.

KPI:

Top-performing city by GMV: **Delhi**

Recorded GMV: ₹3,81,366

9. Average Discount Levels (Operational View)

The average discount applied across all orders is 14.48%, and this is fairly consistent across cuisine categories — an indicator of stable, platform-level discounting rather than cuisine-specific price wars.

Figure 7. Average discount % by cuisine

INSIGHTS:

- Chinese has the highest average discount (14.52%), closely followed by Italian (14.50%).
- Desserts & Bakery has the lowest average discount (14.35%), though the spread across categories is under 0.2 percentage points.
- This tight spread suggests a fairly uniform discounting approach across the catalog rather than deep cuisine-specific promotions.

KPI:

Average discount (overall): **14.48%**

Highest-discount category: **Chinese (14.52%)**

Lowest-discount category: **Desserts & Bakery (14.35%)**

10. Regional Demand

Order demand is distributed across 14 cities (excluding 35 rows with an unrecorded city). Delhi has the highest order volume in the supplied data at 1,033 orders. Regional demand analysis can support fulfilment planning, city-level marketing spend, and delivery-partner coverage.

Figure 8. Regional demand — orders by city

INSIGHTS:

- Demand is distributed across 14 cities without one dominant hub.
- Delhi represents the strongest demand market in the dataset, narrowly ahead of Mumbai.
- City-level demand information can support dark-kitchen and delivery-fleet coverage decisions.

KPI:

Top-performing city: **Delhi**

Order volume: **1,033**

Cities covered: **14 (+35 records with unrecorded city)**

11. Repeat-Customer Share vs Order Volume

The relationship between the share of repeat customers and order volume by city gives an additional descriptive view of city-level customer loyalty. Cities with a higher repeat-customer share do not necessarily have higher order volume, but the scatter should be read as association rather than causation.

Figure 9. Repeat-customer share vs order volume by city

INSIGHTS:

- Repeat-customer share sits in a fairly tight band (51%–63%) across all cities, showing broadly consistent loyalty patterns nationally.
- Kochi has the highest repeat-customer share ($\approx 62.5\%$) despite a comparatively small order volume.
- Average order value (colour scale) does not vary strongly with either order volume or repeat share.

KPI:

Overall repeat-customer share: **55.27%**

Highest repeat share: **Kochi ($\approx 62.5\%$)**

Lowest repeat share: **Chandigarh ($\approx 51.1\%$)**

12. Weekday vs Weekend Order Pattern

Across the daily observations, average orders are 112 per day on weekdays versus 145 per day on weekends — weekends run noticeably busier.

Figure 10. Average daily orders: weekday vs weekend

INSIGHTS:

- Weekend order volume is about 29% higher than weekday volume on average.
- Average order value is nearly identical on weekends and weekdays ($\approx ₹369$ vs $\approx ₹368$), so the weekend uplift is driven mainly by order count rather than basket size.
- This pattern can inform weekend-specific delivery-partner staffing and promotional timing.

KPI:

Average weekday orders/day: **≈ 112**

Average weekend orders/day: **≈ 145**

13. Customer Rating (CSAT Equivalent)

The overall average delivery rating is 4.15 / 5. Ranchi has the highest average rating at 4.17, while Hyderabad has the lowest at 4.13. Rating is not recorded for 985 orders in the supplied data ($\approx 9.01\%$).

Figure 11. Average delivery rating by city

INSIGHTS:

- Ratings are tightly clustered between 4.13 and 4.17 across all cities, showing no city with a clearly poor delivery experience.
- Hyderabad's comparatively lower rating may warrant closer investigation into delivery-time or order-accuracy feedback.
- Rating should be considered alongside operational KPIs such as discount levels and repeat-customer share.

KPI:

Highest-rated city: **Ranchi (4.17/5)**

Lowest-rated city: **Hyderabad (4.13/5)**

Overall average rating: **4.15/5**

14. Summary of Key Metrics

Metric	Value
Total orders	10,932
Total GMV	₹40.22 Lakh (₹40,21,991.68)
Average discount	14.48%
Average delivery rating	4.15 / 5
Average delivery time	≈34 minutes
Cities tracked	14 (+35 unrecorded)
Cuisine categories tracked	5
Repeat-customer share	55.27%
Dataset records	10,932
Date range	1 Apr 2026 – 29 Jun 2026 (90 days)

15. Next Steps to Move from Descriptive → Predictive

- Demand forecasting by city and cuisine to estimate future order volumes.
- Anomaly detection for sudden changes in discount levels, GMV or order volume.
- Churn analysis linking repeat-customer share to marketing and retention spend.
- Basket-level analysis using average order value and items per order.
- Delivery-time analysis linking rating to delivery duration and distance.
- Trend and cohort analysis when a longer historical window becomes available.

This report answers what happened in the supplied dataset. The next analytical layer would use a longer time period and richer event-level data to explain why changes occurred and to forecast what is likely to happen next.

16. Glossary

- GMV — Gross Merchandise Value: Total monetary value of orders placed through a platform before deducting fees, discounts already applied, refunds, or other adjustments. Here it is calculated as the sum of `order_value_inr`.
- MRP — Maximum Retail Price: The listed menu price of an item before any discount is applied.
- City Tier: A classification of Indian cities by size and economic activity (e.g., Tier 1, Tier 2/3), commonly used for regional business planning.
- Repeat vs New Customer: A flag indicating whether an order was placed by a customer with a prior order history (Repeat) or a first-time customer (New).
- Rating: A post-delivery customer rating (out of 5), used here as a proxy for customer satisfaction (CSAT).
- Delivery Time: Time in minutes between order placement and delivery completion.

THANK YOU
